

Challenge FEEDERS

Every inserter in our Challenge line comes available with *Mix and Match* Technology. This allows you to configure your machine with 1 of 4 different insert feeder types. This gives you the flexibility to process everything from glossy inserts to booklets. You no longer have to settle for a "One size fits all" feeder solution. Its your call!

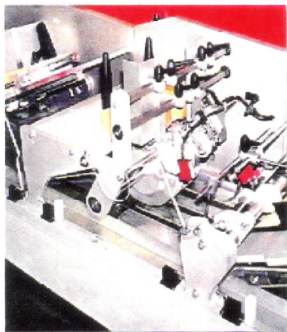

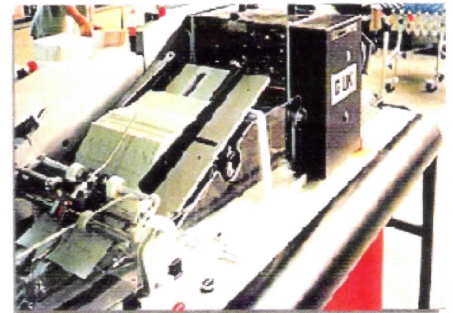

<<Bottom Side Friction Feed

The bottom side friction feeder is a great option for your thicker inserts. When equipped with the optional "lugs", the bottom friction feeder will feed inserts up to 112 ". Electronic miss and double feed detection is standard. As with all Challenge feeders, set-up is quick and intuitive, keeping overall set-up time to a minimum.

Top Side Friction Feed>>

Our Top Side Friction is the workhorse of feeders that will cleanly and consistently feed a majority of your inserts. The top feed de-sign also allows for the feeding of open edge inserts without the worry catching the open edge and destroying the insert

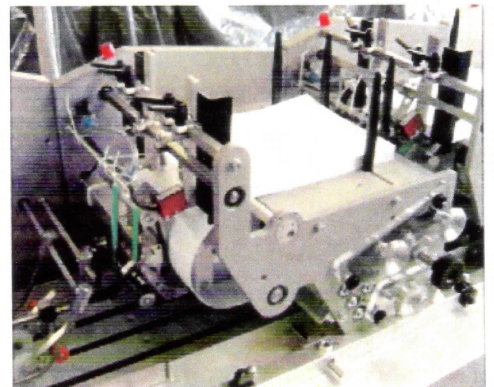

<<Rotary Feed

For those glossy inserts that just won't run on a friction feeder, we give you the option of a Vacuum feeder. Your insert is pulled into a waiting position by vacuum, then positively transferred to the main transport by a series of grip-pers. Our Suction Drum Feeder offers the same user friendly design and quick set up to keep your work moving!

Rotary feeder folder>>

New to the Mix and Match line-up is the rotary feeder folder. Remove the unnecessary step of folding offline and increase productivity by folding during the inserting process! The rotary feeder folder accepts up to 8.5 x 11 inch documents and folds them inline with no sacrifices in machine throughput. Eliminate a complete step in your process and save money!
